FOREWORD

This research was conducted under program element 63707N project R1770-MP008, sponsored by the Chief of Naval Operations (OP-01) and work request sponsored by the Naval Military Personnel Command (NMPC-7). The objective of this task was to develop a defensible method to forecast Permanent Change of Station (PCS) operational, rotational, and training (ORT) move counts for use in budget development.

This report describes a systematic, objective method to forecast PCS ORT moves. The method is then used to forecast FY89, FY90, and FY91 PCS ORT moves using (1) FY88 actual move patterns and (2) the end FY88 distribution of projected rotation dates (PRDs). The methodology can be applied at the end of any given fiscal year to forecast PCS ORT move counts for each of the next 3 years.

SUMMARY

This report describes a simple, objective method to produce Permanent Change of Station (PCS) move forecasts for use in budget development and execution. The forecasts assume that current PCS move policies will remain in effect throughout a 3 year forecast horizon. The forecasts are produced using a technique called tree classification, which stratifies Officer and Enlisted members into groups based on their Projected Rotation Date and Accounting Category Code. Each group's move behavior is projected separately, then combined to produce aggregate forecasts.

Tree classification is used in this report to develop PCS move forecasts for FY89, FY90, and FY91 based on FY88 actual move behavior. The move projections are produced at levels of detail sufficient to develop the Military Personnel Navy (MPN) budget and to monitor budget execution. Forecasts are produced for Officer/Enlisted, month, detailing branch, and move type (Operational, Rotational, and Training.(ORT)).

The method and forecasts are useful for a variety of reasons. The forecasts are based on simple, known assumptions and provide an objective estimate of future PCS moves. Thus, these forecasts can be used as a starting point for what-if analyses, since these forecasts assume no changes in current PCS policies. Finally, the projections can be used as a baseline for comparison to detailer-specified move requirements.

INTRODUCTION

Problem

For budget development purposes, the Navy needs objective, defensible forecasts of Permanent Change of Station (PCS) moves. Move forecasts for budget development have been derived from decentralized, ad hoc methods. These forecasts have been difficult to defend in budget reviews. Defensible forecasts would ensure that sufficient funds are allocated to support PCS move policies. These forecasts would also alert planners when policy changes are needed to stay within budget.

Objective

This report describes a statistical method for forecasting the number of PCS moves the Navy expects to make over a 3 year planning horizon. These methods are based on current and historical PCS move patterns and reflect the anticipated number of moves necessary if underlying PCS move impacting policies remain constant over the forecast horizon.

After some background on PCS moves, the report describes the method used to make the forecasts. Then, model estimates are shown for FY89, FY90, and FY91. Appendix A contains detailed tables of officer FY86-FY88 PCS actual operational, rotational, and training (ORT) moves and the FY89-FY91 forecasts by month and detailing branch. Appendix B contains similar tables for the enlisted members.

PCS Budget Development

The Naval Military Personnel Command's MPN Financial Management Department (NMPC-7) is responsible for developing and executing the Navy's manpower appropriation, also known as Military Personnel, Navy (MPN). The MPN submission is reviewed at least three times, first, by the Comptroller of the Navy, then, by the Office of the Secretary of Defense (OSD), and finally, by Congress. This process, diagrammed in Figure 1 for the FY91 budget, takes most of the preceding 2 fiscal years (FY89-FY90) to complete.

Figure 1. MPN budget development (NMPC-7).

In addition to pay and allowances, the MPN appropriation includes reimbursements for expenses incurred to move members and their dependents between duty stations. These transfers are known as PCS moves. To support budget development, a forecast of PCS moves must be made for the current year (CY) and the next 2 years (CY + 1, CY + 2).

The budget contains estimates for six types of PCS moves. The number of FY88 moves for each of the six types is listed in Table 1. Accession, separation, and organized unit moves are referred to jointly as "mandatory" moves, because the Navy has limited control over such moves. Mandatory moves are relatively fixed once strength objectives are agreed upon. In contrast, ORT moves are referred to as "discretionary" moves. These moves are a function of sea/shore rotation policies, current management practices, and training plans.

Table 1
FY88 PCS Cost Moves

Move Type	Officer	Enlisted
Mandatory		
Accession	5,993	96,684
Separation	5,943	88,902
Organized Unit	763	6,152
Total	12,699	191,738
Discretionary		
Operational	7,465	33,252
Rotational	5,205	29,485
Training	8,304	26,556
Total	20,974	89,293
Total	33,673	281,031

Source. 30 Sep 88 S8330 Report (PCS Variance Analysis Division, Navy Family Allowance Activity).

Since the Navy has limited control over "mandatory" PCS moves, the emphasis of this investigation was to develop forecasts for "discretionary" PCS move types.

Previously, NMPC's enlisted detailing branches derived independent forecasts of their PCS moves. These forecasts were then combined to produce a total enlisted PCS ORT moves forecast. The detailing branches produced their forecasts using a variety of undocumented techniques. Some branches used the Projected Rotation Date (PRD) as a basis for predicting future PCS moves, while other branches used last year's moves with an inflation factor. In most cases, the branches were able to provide little defense for their forecasts.

The Navy's inability to defend a PCS budget required to support its move policies has lead to erratic aggregate move patterns. These patterns are displayed in Figure 2 for officer and enlisted ORT moves, respectively.

OFFICER DISCRETIONARY MOVES

ENLISTED DISCRETIONARY MOVES

Figure 2. Officer and enlisted operational, rotational, and training moves.

APPROACH

A technique known as "tree classification" was used to generate move forecasts. Tree classification assigns the "target population" (every member on active duty in the Navy during the forecast horizon) to exactly one class. The classes are designed so that the move behavior of the individuals within a class will be homogeneous. The tree classification model assumes that current PCS move policies will remain in effect during the forecast years, implying that the within-class impact of these policies on move behavior will also remain constant. Thus, no trend is assumed in the model. The classification tree used in the analysis is shown in Figure 3.

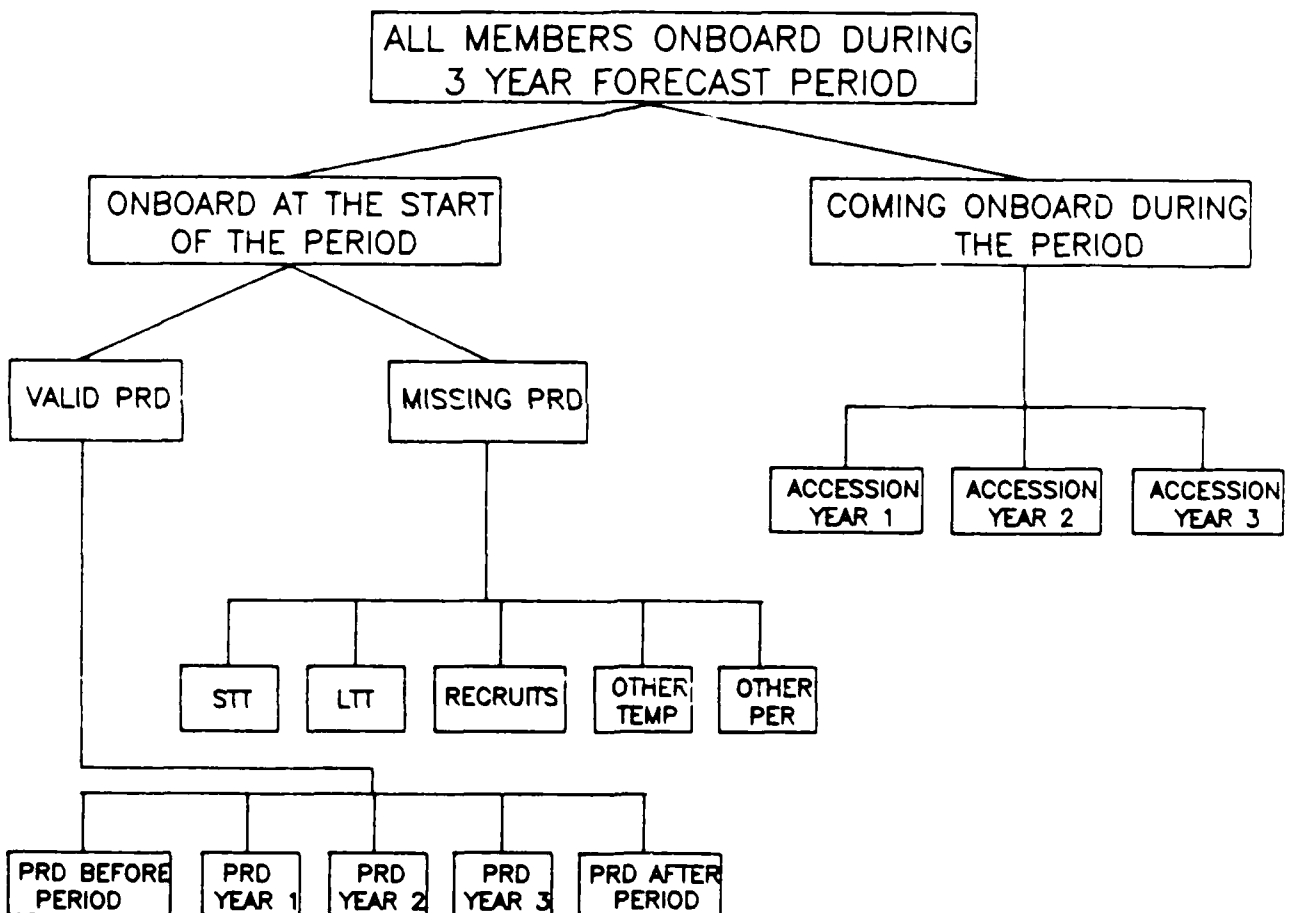

Figure 3. Classification tree.

Initially, the tree distinguishes between members onboard at the beginning of the 3 year forecast horizon and those members who will enter the Navy sometime during the forecast horizon. Since little is known about future accessions, these members are classified only by their accession year. The actual number of members falling into these

accession groups is not known in advance. The ideal estimate would be the latest accession plan. However, in the absence of accession plans, the number of accessions from the most recently completed fiscal year is used. The specific accession counts assumed for the projections in this report were 7,500 officers and 86,000 enlisted. These counts represent those accessions expected to "survive" through the end of their year of entry. (These counts are roughly the number of "surviving" accessions during FY88.)

Most members onboard at the beginning of the forecast horizon have a PRD, the date the Navy expects to move the member to a new duty assignment. The tree classifies these members by the year of their PRD. Most members have a PRD occurring within the forecast horizon. These members are classified into one of three groups: Members with a PRD falling within the first forecast year (for example, FY89); members whose PRD falls in the second forecast year (FY90); and members whose PRD is in the third forecast year (FY91, the Program Objectives Memorandum (POM) year). All members with a PRD occurring prior to the forecast horizon are classified into a fourth group. Members whose PRD extends beyond the forecast period comprise a fifth classification group.

The remaining unclassified members have no PRD. Most of these members are in temporary duty or in training. The Accounting Category Code (ACC) is used to further classify these members. Enlisted members are classified into five groups. The three largest categories are short-term training (STT), long-term training (LTT) (which covers training lasting more than 20 weeks) and recruit training. The remaining two categories, Other Temporary Duty and Other Permanent Duty are small miscellaneous categories containing the remaining members. Officers, however, are only classified into two groups, Other Temporary Duty and Other Permanent Duty. Both of these groups are small because most officers have a PRD.

Once individuals have been grouped into classes using the classification tree, PCS move forecasts are made for each class separately. A set of within-class probabilities gives the proportion of the class expected to make PCS moves for each of the next 3 years. Separate forecasts are made for each cost/total, O/R/T, and detailing branch combination.

For each forecast year, a within-class probability is calculated for each of these type of moves. For example, one within-class probability would be the proportion of all enlisted members currently in long-term training who would be expected to make an Operational, Cost PCS move in January FY89 and who are detailed by NMPC-402, the Engineering/Hull Assignment Branch. The move type is a Cost/Op/FY89/Jan/N-402 move.

For the non-accession classes, the forecast for a move type is the product of the number of members onboard in the class at the end of FY88 and the within-class probability for that move type. For accession classes, the forecast is quite similar, being the product of the projected "surviving" accessions and the within-class probability for that accession class. This product represents the number of members in the class that would be expected to make that type of PCS move. Move forecasts are summed across classes to yield forecasts by the types listed in Table 2.

Table 2
PCS ORT Cost Move Forecasts

Year	Officer Cost Move Forecasts			
	Cp	Rot	Tra	Total
FY89	7,270	5,086	8,251	20,607
FY90	7,430	5,170	8,059	20,659
FY91	8,178	5,581	7,906	21,665

Year	Enlisted Cost Move Forecasts			
	Cp	Rot	Tra	Total
FY89	31,686	28,219	26,424	86,329
FY90	33,172	29,506	27,079	89,757
FY91	34,712	30,629	27,604	92,945

Calculating Within-class Probabilities

The within-class probability of making a PCS move during the forecast horizon is calculated using only the most recent move behavior, in this case, FY88. The within-class probabilities of moves 1 year ahead (FY89) is derived using the move behavior of members whose classes are based on the Officer Master File (OMF) and Enlisted Master Record (EMR), 1 year previous (FY87). The within-class probability of an FY89 move for move type I within-class C, is defined as:

$$\text{PROB}(I,C,\text{FY89}) = \frac{\text{Number of FY88 Moves of Move Type I Made by End of FY87 Members of Class C}}{\text{Number of End FY87 Members in Class C}}$$

The derivation of within-class probabilities for FY90 is analogous to the FY89 procedure, except the end FY86 master files are used instead of the end FY87 master files. In this case, the FY88 actual move behavior represented moves 2 years in the future, and hence, is used to forecast FY90 (2 years ahead) moves rather than FY89 (1 year ahead) moves. Similarly, end FY85 master files were paired with FY88 moves to construct within-class probabilities for 3 years ahead (FY91) moves.

The within-class probabilities for FY90 and FY91, respectively, are:

$$\text{PROB}(I,C,\text{FY90}) = \frac{\text{Number of FY88 Moves of Move Type I Made by End of FY86 Members of Class C}}{\text{Number of End FY86 Members in Class C}}$$

and

$$\text{PROB}(I,C,\text{FY91}) = \frac{\text{Number of FY88 Moves of Move Type I Made by End of FY85 Members of Class C}}{\text{Number of End FY85 Members in Class C}}$$

RESULTS

Table 2 gives PCS ORT cost move forecasts for FY89, FY90, and FY91. The primary reason for the increasing number of moves is the unusually high number of accessions during FY88 that "survived" their first year. These accessions made few ORT moves in FY88 but will be expected to make increasing numbers of ORT moves throughout the forecast horizon. In addition, the actual accession counts of surviving accessions during FY88 were used to forecast surviving accessions for FY89, FY90, and FY91. This higher than average accession survival rate would also drive the forecasts up somewhat.

Forecasts by Detailing Branch

These forecasts are constructed using FY88 actual move rates by branch. The results suggest considerable variation in the distribution of ORT moves among the detailing branches. For instance, the enlisted Submarine community makes numerous training moves, but relatively few rotational moves. In contrast, the Administration/Deck/Supply community makes few training moves. Their moves are largely operational and rotational.

These forecasts by detailing branch can aid in the defense of the budget submission. When budget cuts are contemplated, these forecasts will show which branches will have to absorb the reductions and those likely to be less affected. Thus, they will permit a more detailed response to proposed cuts.

The FY91 move forecasts are displayed for officers and enlisted members in Figure 4. FY89 and FY90 forecasts are quite similar and are omitted. Detailed tables of all forecasts are provided in Appendices A and B.

Forecasts by Month

Monthly forecasts for FY89-FY91 are calculated using the average of the last 3 years' move rates for each move type, assuming that moves of the particular type are made in all 3 years. Otherwise the average of the available move rates is used. The monthly officer and enlisted forecasts for FY91 are displayed in Figure 5. Detailed forecasts for all years are provided in Appendices A and B.

Figure 5. FY91 monthly forecasted moves for officer and enlisted members.

CONCLUSIONS

The tree classification model assumes that the current PCS policies will remain in effect throughout the forecast period, and there will be no trend in the within-class move rates. This approach produces objective forecasts that are simple to understand and improves the defense of the PCS budget by indicating groups of members (e.g., ratings) that will be forced to absorb the impact of any PCS changes. Finally, the model also provides accurate starting values of the number of PCS moves that are needed to execute current PCS move policies.

APPENDIX A
Part II

FY89, 90, and 91 Forecasted Officer ORT Moves Distributed to
Months of Detachment and by Detailing Branches
(Number of Moves and Percent Distributions)*

*Includes separate tables for cost moves and for total moves.

Officer PCS Move Forecasts Using 88 Rates.
By Detailing Branch

APPENDIX B
ENLISTED ACTUAL AND FORECASTED ORT MOVE COUNTS

APPENDIX B
Part I

FY86, 87, and 88 Enlisted Actual ORT Move Counts/Percentages
by Month of Detachment and by Detailing Branch*

The branches described in the main body of the paper are groupings of the NMPC detailing branches. The groupings are listed. The tables below indicate which NMPC branches are grouped to get the tables in the main body.

Enlisted Branch Groups

EPMA	EPMAC
N-401	Seabee/SEAL
N-402	Engineering/Hull
N-403	Submarine
N-404	Aviation
N-405	Admin/Deck/Supply
N-406	Technical
N-407	Medical/Dental
N-408	Cryptology
N-409	Sea Special

*Includes separate tables for cost moves and for total moves.

Unlisted Actual PCS Moves,
